

Concrete steps

Cascading steps can be used at sliding doors and other raised entrances. Keep in mind that these steps can take away a significant amount of patio space if they are more than two steps high.

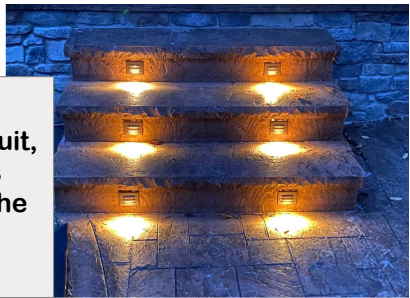

Longer flights of steps typically have one or more landings. These help adjust for the rise and run of the steps and also provide a break to the profile.

Cantilever style (integrated lip) steps with traction strip inserts. These strips are an important consideration when there is no plan to install a handrail.

Even plain concrete steps can be structured to be more aesthetically pleasing.

Electrical boxes, conduit, and wires for lights are installed before the concrete is placed

Herringbone brick stamped steps with a brick border, cantilever style (integrated lip)

Cantilever style (integrated lip) steps in plain concrete with brushed treads

Cascading steps with Split Stone faces and brushed treads

Split Stone faces and stamped treads.

Flat faces and flat sides with lightly stamped treads
